

Dissolved oxygen in seawater

Units and ranges

- O_2 is usually measured in mg L^{-1} or ml L^{-1}
- **Dissolved oxygen in seawater ranges from 0-10 mg L^{-1}**
- The atomic mass of O_2 (32g) corresponds to 22.4 litres at STP, so $5 \text{ ml L}^{-1} = 5 \times 32/22.4$ i.e. about 7 mg L^{-1}
- The maximum oxygen concentration in seawater ($\sim 7 \text{ ml L}^{-1}$) is therefore about 30 times lower than in air (200/7)
- The solubility of oxygen depends on the salinity and temperature of the water.
